

seven-factor structure, I renamed these factors to better capture each factor's overarching theme. The conceptual evolution of the original six-factor model to the new seven-factor model is shown in Figure 5. The factor loadings are listed in Table 7.

Figure 5. Adapted biodata factor model after Study 1 EFA

The second factor, “STEM Knowledge and Experiences,” represented non-competitive experiences in which students learned about STEM topics. It comprised primarily items from the former “Exposure to STEM” and “Receiving Resources” categories. Again, students did not appear to perceive a distinction between receiving resources and receiving verbal support. Instead, the distinction appeared to be whether the support was STEM-specific.

The third factor, “Extracurricular Math Competitions & Activities,” comprised the math items from the original “STEM Competitions” factor. It represented a need to reframe my original conceptualization that participation in math and science competitions captured the same construct. Students appear to experience math competitions differently from science competitions, and there may be little to no correlation between having science and math competitions or experiences. The factor structure also implied that students who participate in math competitions may also enjoy other extracurricular math activities.

The fourth factor, “Proactive and Voluntary STEM Behavior,” comprised six of the items from the original “Proactive Behavior” category. This finding meant that the original factor structure that included proactive behavior as a distinct construct was supported, albeit with the need to remove some items that were better categorized under different factors.

The fifth factor, “Parental Statements of Support for STEM,” comprised primarily items from the original “Exposure to STEM” factor. It consisted of items representing parents verbalizing support for their children pursuing a STEM interest or career, or providing the resources to do so. As previously discussed, I had not anticipated that students would be able to differentiate clearly between their parents supporting them academically in general and with STEM in particular, but this emerged as a clear distinction in these data.

The sixth factor, “Skill and Helpfulness of Teachers,” comprised primarily the teacher-specific items from the original “Help from Others” factor. It consisted of the influence of teachers in providing support, or being perceived as willing to do so, to students. Students appeared to experience support and help from their teachers differently from these same experiences with their parents, and the two experiences were not interchangeable or necessarily similar.

The seventh factor, “Extracurricular Science Competitions & Activities,” comprised primarily the science-specific items from the “STEM Competitions” factor, as well as the “Hands on STEM Activities” factor. As discussed with the math competitions factor, students did not necessarily like or participate in both math and science competitions. The students who enjoyed and participated in science competitions also tended to enjoy extracurricular science activities and hands-on activities.

Examining differences by race and gender, White students reported higher general parental support but lower parental STEM support than underrepresented minority (Black and Hispanic) students. White parents may have benefited from a position of relative privilege in society and greater knowledge of how to advocate for their children in American elementary schools. The parents of underrepresented minority students, conversely, appeared to place a greater value on the utility of obtaining a STEM degree and pursuing STEM interests than White parents did, perhaps as a result of prioritizing their children obtaining a relatively secure and/or high-paying job in an uncertain professional world that might disadvantage employees from underrepresented backgrounds. The other biodata factors, including STEM knowledge and experiences, participation in math competitions and extracurricular activities, proactive STEM

behavior, teacher support, and participation in science competitions and extracurricular activities, were not significantly different by race.

Regarding gender, there were no significant differences between any of the biodata factors, although the parental STEM support factor was marginally significant in favor of slightly greater support reported by female participants. Based on prior research on gender differences in elementary school STEM experiences, this finding might appear to be counterintuitive; however, parents may have perceived that their daughters would benefit more from explicit support to pursue STEM due to awareness of gender barriers in STEM fields. An alternate explanation might be that female students who persisted to the point of matriculating as a STEM major at Rice may have required stronger parental support to persist in STEM.

Many of the correlations between the biodata factors and math standardized tests scores were small, with significant but small positive correlations suggesting that students who perceived higher general academic support from their parents, had learned about STEM, and who had voluntarily sought out STEM activities and knowledge in elementary were more likely to have higher math standardized test scores in high school. Conversely, participating in science or math competitions, receiving STEM-specific encouragement from parents, and having helpful, skilled teachers in elementary school did not contribute to math standardized test scores. These results suggest that elementary school students who tend to build STEM-specific knowledge, especially if done so proactively, with the support of their family are those who will perform most highly on the math ACT and SAT sections.

Students' STEM identity demonstrated small correlations with their participation in math competitions, their tendency to voluntarily seek STEM knowledge, and the skill and support of their teachers. These small correlations may be a function of range restriction in this sample,

of STEM formative experiences and personality traits may be more nuanced than previously recognized, with different personality traits contributing to different experiences (and perhaps perceptions of outside experiences) by students.

This study allowed for a more refined measure of STEM formative experiences to be developed after the first step in validating the measure on a sample of STEM students (see Appendix I). After reframing and reallocating items to a modified factor structure, many of the factors demonstrated the expected correlations with other constructs and were interpretable; however, these correlations were in many cases relatively small. Given the large time gap between the end of elementary school and students' time in college, many other factors could also impact students' STEM performance, behavior, and other variables. However, the fact that significant correlations were found at all is promising and supports the value of further refining the measure and testing its predictive validity on long-term outcomes. Further, it is worth noting that the students in this study were not only academically successful in high school, they also declared a STEM major upon matriculation to Rice (although many students later left STEM). Range restriction in this sample of highly STEM interested students may have reduced the strength of correlations found, compared to administering this measure on a broader sample of students. However, a strength of this sample was in ensuring that many of these students would presumably have significant early experiences in science or math that a biodata measure could capture. Regardless, the broader validity of the biodata measure will need to be established on a wider (i.e. not STEM-specific) sample.

their initial STEM major, and students' STEM GPAs to correlate with their intended major. See Figure 6 for the model to be tested in the structural equation model.

items to attempt to better differentiate between the two constructs in future studies. For most of the remaining items, there was general overlap among STEM knowledge, parental support of STEM, and voluntary STEM behaviors. Again, because the CFA showed support for a seven-factor solution and thus these three factors being conceptually distinct, I re-wrote these items as well. All identified items (including items similar or identical to those identified in Study 1) and proposed changes to the items to more explicitly load onto the hypothesized scales are listed in Table 18.

Structural Equation Model

Using a structural equation model that incorporated the survey data and objective academic data, I evaluated whether the relationships between constructs followed those predicted by the SCCT model, and whether the biodata measure predicted second-semester college major and post-college career plans. I included STEM GPA for the fall, science and math AP courses taken in high school, and AP STEM credits transferred to Rice in the model, in addition to the survey items. In the model, I also allowed correlations between these variables, as well as math standardized test scores. The original model incorporated two to five observed variables for each of the seven constructs, meaning the model was based on 24 observed variables. See Figure 6 on page 84 for the model tested.

First, I ran the originally hypothesized structural equation model. It was a poor fit for the data ($CFI = 0.781$, $TLI = 0.737$, $RMSEA = 0.094$). I then trimmed this model and excluded the three non-significant paths: 1) the teacher biodata factor, 2) science and math AP classes taken, and 3) Fall 2019 STEM GPA. Although doing so improved the fit ($CFI = 0.804$, $TLI = 0.767$, $RMSEA = 0.093$), it was still unacceptably low.

I examined the modification indices for insight into whether there might be a better way to model these data. I did not alter the path from the background experiences to formative experiences constructs, nor the path from initial major to intended major, with the perspective that retaining these paths was essential to capturing the basic premise of the SCCT model. In other words, only the relationships among interest, self-efficacy, and career outcome expectancies were explored for modification. The modification indices showed many significant relationships between science interest and science career expectations; math interest and math career expectations, and STEM career outcome expectations and STEM career interest,

Discussion

Results from the confirmatory factor analysis indicated acceptable but not high fit for the factor structure of the biodata measure, after certain items were eliminated due to misleading item content or by demonstrating low factor loadings in both Study 1 and Study 2. All findings are exploratory. Broadly speaking, the general parent support and the teacher support factors loaded most cleanly onto their hypothesized factor structures, followed by the parent support of STEM factors, which also had generally high loadings for most items. The parent-child relationship seemed to be more interrelated than many students in the original interviews that informed item development seemed to articulate or may have even realized (Bradford, 2018). For example, there were considerable cross loadings on many items in the voluntary behaviors and parents' supporting STEM factors. Parents might support STEM in response to students' behaviors or interests, and/or students who voluntarily participated in a science or math activity may also have been heavily influenced by their parents to pursue this interest.

In terms of the impact of teacher support, most items loaded cleanly onto this factor. After reviewing the items with high modification indices (see Table 18) and finding certain negative correlations between the teacher and parental support factors, it appears that students in this sample used their teachers for support if they did not have strong parental encouragement, meaning that the positive effect of teacher support and encouragement was not additive but compensatory in teachers' abilities to replace insufficient support or encouragement by parents. Whether or not this relationship holds true in other samples should be further studied.

The math competitions and activities factor showed cross-loadings with the science competitions and activities factor, although the model was still a better fit when the two were considered separate constructs. Students who look forward to math extracurricular activities and

likely to report that their parents encouraged them to pursue STEM interests or careers specifically, replicating a finding in Study 1. As previously discussed, underrepresented minority parents might place a higher priority on their children working in STEM careers, perhaps because they view these careers as well-paying and/or reliable (which the content of several of the biodata items for this factor addressed) in a job world that might create additional barriers for underrepresented minority students.

Regarding gender differences, male students tended to report more proactive behavior toward STEM than female students, a difference that favors the majority group, just as White students reported more proactive behavior than underrepresented minority students. Male students may be more comfortable operating in math and science domains than female students, due to factors mentioned in Chapter 2, such as a tendency for science and math textbooks to emphasize the contributions of male scientists and mathematicians and to use traditional masculine interests when providing examples. Second, males reported greater participation in extracurricular science competitions and activities, which reflects findings in the literature that female students often have less access to science equipment, as well as tending to find fewer science activities that interest them. No other biodata factors differed as a function of gender.

I also examined correlations between individual biodata factors and other constructs captured in this study. Four of the biodata factors consistently predicted math, science, and math and science major self-efficacy: STEM knowledge, proactive behavior, and science and math competitions. All four of these factors represent generally active experiences, in contrast to the more passive factors of general and STEM-specific parental support and teacher support. Having these experiences and the opportunities to interact with and learn directly from these experiences while students were young may have influenced their trajectories and led to higher STEM self-

efficacy in college. Parents' support of STEM significantly predicted only science self-efficacy, indicating that students may develop their math and STEM major self-efficacy through other routes than parental influence, and parents may be able to bolster their children's beliefs about their ability to succeed in science topics in a way they are not able to affect their children's math or major self-efficacy.

The same four biodata factors – STEM knowledge, proactive behavior, and science and math competitions – all had significant small to medium correlations with math and task interest. This may be a reciprocal relationship, in which participating in these activities increases interest, which increases students' chances of participating in these activities, or it may be directional, in which interest drives subsequent behavior or vice-versa. As with self-efficacy, parents and teachers do not seem to have a direct impact on children's STEM interests, indicating that active behaviors by children (the biodata factors more relevant to the SCCT formative experiences construct) are more important predictors of students' interest, rather than background experiences factors. These same factors, in addition to parental support of STEM, appeared to drive many of the STEM career outcome expectancies variables, including math and science career outcome expectancies, STEM career plans, and intrinsic career fulfillment. STEM knowledge and proactive behavior in particular positively predicted all four outcomes. These were also the only two factors that predicted intrinsic career fulfillment, which was a measure consisting of the items most relevant to having a STEM career and the degree to which students valued those items in their future career. Conversely, although parental STEM support, science competitions, and math competitions significantly correlated with science, math, and more general STEM career outcome expectancies, they did not correlate with students preferring the

interest. The different order and structure of this model compared to the original SCCT model (in which self-efficacy and career outcome expectations together precede interest, which precede career outcome expectations) may be due to the fact that this sample's students, self-efficacy, interest, and career plans had already changed as a result of their college experiences. Students also appeared to consider their math domain interest similarly to their math career interests, and the same pattern was found for science domain interest and science career interest. In other words, the distinction predicted by the SCCT model of STEM career outcome expectations preceding STEM interest was not supported in this sample. Instead, these appeared to be the same construct. Conversely, science and math constructs appeared to be distinct from each other. Additional research should explore whether this distinction can be replicated on other samples.

Six of the seven biodata factors contributed significantly to the model, with only teacher support showing a positive but not significant path. These findings are promising in terms of the fact that although the biodata measure would benefit from further development, in its current form it was nevertheless significant in a path analysis that culminated in outcomes as distal as students' second semester intended college major and career.

Most of the relationships among objective academic outcomes and other variables were significant in this model, including AP math and science classes taken in high school correlating with math interest and science interest, respectively; math standardized tests correlating with STEM career interest and outcome expectations; and STEM credits transferred to Rice correlating with students' initial major. Interestingly, the only objective academic outcome that did not correlate with either initial major or intended major was students' first-semester STEM GPA (nor was it explained by students' satisfaction with their grades or their perceived course effort). Perhaps students did not interpret their GPA after only one semester as providing

sample of students, including possibly having higher levels of parental support, access to resources, and quality of education than students at less selective universities. For instance, the true relationship between first-year college students' general parental support in elementary school and performance in college might be larger than Study 2 found, but because Rice students tended to report a relatively high level of general parental support, the correlation between these constructs might have been attenuated due to range restriction (i.e. few Rice students reported low levels of general parental support). Further, results from both the confirmatory factor analysis and the structural equation model should be considered preliminary until they can be validated in Study 3 and other follow-up studies. Confirmatory factor analysis findings and modification indices were used to reduce items from the original full biodata measure. Many items also had high cross-loadings in Study 1, and most other problematic items appeared to be result of changes from the original six-factor to the new seven-factor solution and thus made rational sense to exclude; however, these were nevertheless post-hoc changes. Further, refinement and discussion of the structural equation model also involved making several post-hoc modifications after examining the modification indices of the original model. However, these changes largely involved separating math and science factors into distinct constructs, which makes rational and theoretical sense. Nevertheless, an *a priori* model should be tested with science and math factors as distinct constructs in future studies to determine whether these relationships hold true for other samples. Finally, all survey responses were captured at a single point in time, potentially impacting the fit of these data to the original model, which proposes self-efficacy and career outcome expectancies as largely occurring before college.

Conclusion

Together, these studies provided preliminary evidence for the validity of a new biodata measure scale, and then incorporated the updated biodata measure into a structural equation model to test the paths predicted by SCCT. Study 1 involved conducting an exploratory factor analysis and refining the biodata factor structure. In Study 2, a confirmatory factor analysis led to a refined version of the biodata measure, which was then incorporated into a structural equation model. Both studies provided insight into students' early experiences and ultimate college outcomes, from being exposed at an early age to STEM, to pursuing one or more STEM interests, to ultimately to deciding whether to major in STEM at the end of their freshman year of college. Overall, these studies provided evidence for the impact of formative experiences and background experiences in STEM education and on STEM outcomes, a line of research that clearly warrants further exploration.

APPENDIX A

Preliminary Biodata Scale Before Initial Assessment

When you were elementary school age (11 and younger)...

Background Influences

1. Exposure to STEM: Experiences in which students attended or participated in activities about a STEM topic, major, or career path or interacted with people doing STEM research, studying STEM, or working in STEM careers.
 - a. Events
 1. How often did you attend science, math, or engineering shows or demonstrations?
 2. How often did you participate in special science, math, or engineering-focused events for students, such as career days, field trips, or exhibitions?
 3. How often did you attend STEM activities that exceeded one day, such as STEM-related summer camps?
 4. How likely were you to attend or participate in STEM events that were voluntary?
 5. To what extent did your parents support you in participating in STEM activities?
 6. To what extent did your parents communicate that it was more important for you to attend STEM events or activities than non-STEM activities?
 7. How likely were you to seek out information on STEM events you wanted to attend?
 - b. People
 1. To what extent do you have parents, siblings, or extended family who worked in a STEM career?
 2. How often did you interact with adults in STEM fields who were not related to you?
 3. How often did you talk to siblings or cousins who were studying STEM in high school or college?
 4. How often did adults in STEM careers tell you about their career?
 5. How often did adults in STEM careers tell you to consider working in their career?
2. Encouragement for STEM: Experiences in which students perceived favorable messages from family, teachers or others regarding their ability to do STEM or their future major or career prospects in STEM.
 - a. Encouragement for General STEM Interest
 1. To what extent did your parents encourage you to pursue a science, math, or engineering interest?
 2. To what extent did your parents encourage you to pursue STEM at the expense of your non-STEM interests?

3. To what extent did your parents encourage you to follow your passion or interests, regardless of whether they were STEM or non-STEM? (RC)
 4. How often did teachers encourage you to work in science, engineering, or math when you graduated?
 5. How often did your parents or teachers give you STEM-related books, toys, or other STEM gifts?
 6. To what extent did your parents encourage you to pursue a STEM interest due to your innate talent or ability for the topic?
 7. How often did your parents talk to you about taking STEM classes or choosing a STEM major in college?
- b. Encouragement for Specific STEM Career
1. To what extent did your parents encourage you to work in a specific STEM career because that career had high income potential?
 2. To what extent did your parents encourage you to work in a specific STEM career because that career would have jobs available or job stability?
 3. How often did your teachers encourage you to work in a specific STEM career?
 4. To what extent did your family provide you with resources, such as books or movies, about a certain STEM career path?
 5. To what extent did your parents encourage you to work in a specific STEM career due to your innate talent or ability for that career?
 6. How likely were you to tell your parents that you wanted to make your own career choices? (RC)
 7. To what extent did your parents express no specific preference about you following a STEM versus non-STEM career? (RC)

Learning Experiences

1. Hands-on STEM Experiences: Experiences in which the student personally built or interacted with a STEM experiment, project, building, or other construction.
 - a. Self-Motivated Experiences
 1. How likely were you to ask others for STEM-related gifts for your birthday or other holiday?
 2. How often did you choose to work on hands-on STEM activities when you had the choice to do other activities?
 3. How likely were you to work on hands-on STEM activities that were not required for school?
 4. How likely were you to look forward to working on hands-on STEM activities in your classes?
 5. How likely were you to ask your parents for parts or materials so you could work on hands-on STEM activities?
 6. How likely were you to get bored of working on hands-on STEM activities? (RC)
 - b. Parent or Sibling Experiences
 1. How often did your parents encourage you to work on STEM-related experiments or building projects?

2. How likely were your parents to provide you with the materials or instructions to work on STEM-related projects?
 3. How likely were your parents to build or work on STEM projects with you?
 4. How likely were your parents to help you on a hands-on STEM project when you needed help?
 5. How often did your parents suggest new STEM hands-on activities for you to try?
2. STEM Competitions: Participation in competitive activities in which the student was tested in math or science topics.
- a. Math Competitions
 1. How often did you participate in math competitions?
 2. How likely were you to try your best at math competitions?
 3. How likely were you to look forward to math competitions?
 4. How likely were you to participate in math competitions that were voluntary?
 5. To what extent did your parents encourage you to participate in math competitions?
 6. To what extent did your parents encourage you to participate in math competitions?
 - c. Science Competitions
 1. How often did you participate in science competitions?
 2. How likely were you to try your best at science competitions?
 3. How likely were you to look forward to science competitions?
 4. How likely were you to participate in science competitions that were voluntary?
 5. To what extent did your parents encourage you to participate in science competitions?
 6. To what extent did your teachers encourage you to participate in science competitions?
3. School Help Received: Students receiving individual help and/or encouragement from a teacher, parent, or sibling on completing school assignments.
- a. Help from Parents
 1. How often did your parents help you with your homework?
 2. How likely were your parents to ask you if you needed help with your homework?
 3. How helpful did you believe your parents would be if you had trouble with an assignment?
 4. How likely were you to ask your parents for school help if you needed it?
 5. How likely were you to try to figure out your assignments on your own rather than ask your parents for help? (RC)
 - b. Help from Teachers
 1. How helpful did you believe that your teachers would be if you needed help with an assignment?
 2. How skilled did you believe your teachers were at teaching?

3. How often did your teachers encourage you specifically to do well in class?
4. To what extent did you believe your teachers prioritized helping other students over you? (RC)
5. How comfortable did you feel approaching your teacher with class questions?

APPENDIX B

Revised Biodata Scale after Initial Assessment

When you were elementary school age (11 and younger)...

Background Influences

1) Being Exposed or Encouraged for STEM

1. How often did adults in STEM careers tell you about their career?
2. How often did teachers encourage you to work in science, engineering, or math when you graduated?
3. To what extent did your parents encourage you to pursue a science, math, or engineering interest?
4. To what extent did your parents encourage you to pursue a STEM interest due to your innate talent or ability for the topic?
5. To what extent did your parents encourage you to pursue STEM at the expense of your non-STEM interests?
6. To what extent did your parents encourage you to work in a specific STEM career because that career had high income potential?
7. To what extent did your parents encourage you to work in a specific STEM career due to your innate talent or ability for that career?
8. What proportion of your parents, siblings, or extended family worked in a STEM career while you were growing up?
9. How close were you to siblings or cousins who were studying STEM in high school or college?
10. To what extent did your parents encourage you to work in a specific STEM career because that career would have plenty of jobs available?
11. To what extent did your parents say that they supported you in you participating in STEM activities?
12. How often did you talk to siblings or cousins who were studying STEM in high school or college about STEM topics?
13. How likely were you to be interested in a school topic if your parents did not encourage it? (RC)
14. To what extent did your parents encourage you to work in a specific STEM career because that career would have job security?
15. How often did your parents express a specific preference about your career choices?
16. To what extent did your parents encourage you to follow your passion or interests, regardless of whether they were STEM or non-STEM?
17. How often did your parents talk to you about the importance of taking science and math classes?
18. How often did your parents talk to you about the importance of choosing a STEM major in college?
19. How often did adults in STEM careers tell you that you would do well in a similar career?

20. How often did your teachers encourage you to work in a specific STEM career?
21. How often did you interact with adults in STEM fields who were not related to you?

2) Being Provided STEM Resources

1. To what extent did your parents provide financial support for you to participate in STEM activities?
2. How often did your parents or teachers give you STEM-related books, toys, or other STEM gifts?
3. How likely were your parents to provide you with the materials to work on STEM-related projects?
4. To what extent did your family provide you with books, movies, or TV shows about a certain STEM career path?
5. Were your parents more likely to pay for you to participate STEM activities than in non-STEM activities?
6. How often did your parents encourage you to work on STEM-related projects?
7. How willing were your parents to pay for new STEM activities for you to try?
8. How often did you attend multi-day STEM events, such as STEM-related summer camps?
9. How often did you participate in non-competitive science, math, or engineering-focused events for students, such as career days, field trips, or exhibitions?
10. How often did you attend one-day science, math, or engineering events, such as talks or demonstrations?

Learning Experiences

3) Having Hands-on STEM Experiences

1. How likely were you to get bored of working on mandatory hands-on STEM activities? (RC)
2. How much did you look forward to working on hands-on STEM activities in your classes?
3. How much did you generally prefer to work on hands-on STEM activities compared to other hobbies?
4. How often did you work on science experiments or projects in class?
5. How much access did you have to hands-on STEM materials at home?
6. How willing were your parents or other family members to pay for hands-on STEM project materials for you?
7. How often did you work on engineering, building, or construction projects in class?
8. How often did you work on science fair projects at school?
9. How often did you go on field trips to activities or places where you were able to touch or build things?
10. How often did you do hands-on math assignments, such as math blocks, puzzles, geometry projects, or filling in graphs or charts?

4) Participating in STEM Competitions

1. How likely were you to participate in math competitions that were voluntary?
2. How likely were you to participate in science competitions that were voluntary?
3. How likely were you to spend a lot of time after school preparing for math competitions?
4. How likely were you to spend a lot of time after school preparing for science competitions?
5. How much did you look forward to opportunities to participate in math competitions?
6. How much did you look forward to opportunities to participate in science competitions?
7. How often did you participate in math competitions?
8. How often did you participate in science competitions?
9. To what extent did your parents expect you to participate in science competitions?
10. To what extent did your teachers encourage you to participate in science competitions?

5) Receiving Help on School Assignments

1. How capable were your parents of helping you on a math assignment if you needed help?
2. How capable were your parents of helping you on a science assignment if you needed help?
3. How helpful were most of your teachers if you were struggling with an assignment?
4. How often did your parents help you study for tests?
5. How skilled were most of your teachers at explaining new topics to the class?
6. How helpful did you think your parents would be if you had trouble with an assignment?
7. How often did your parents ask you if you needed help with your homework?
8. How often did your teachers specifically encourage you in particular to do well in class?
9. To what extent did you believe your teachers prioritized helping other students over you? (RC)
10. To what extent did your parents expect you to figure out difficult class assignments on your own? (RC)

6) Proactive or Voluntary STEM Behaviors

1. How often did you choose to work on hands-on STEM activities (e.g. experiments, building projects, lab activities) after school when you had the choice to do other activities?
2. How likely were you to ask others for STEM-related gifts for your birthday or another holiday?
3. How likely were you to seek out information on STEM events you wanted to attend?
4. How likely were you to ask your parents for parts or materials so you could work on hands-on STEM activities?
5. How likely were you to choose to attend or participate in STEM events that were voluntary?
6. How likely were you to look up instructional videos or books to complete difficult assignments on your own?
7. How comfortable did you feel approaching your teacher with science or math questions after class?

8. How comfortable did you feel asking your teacher science or math questions during class?
9. How likely were you to ask your parents for help with a class assignment if you were struggling with it?
10. How likely were you to work on extracurricular or extra credit math assignments just because you wanted to?
11. How likely were you to work on recreational science projects just because you wanted to?

APPENDIX C

Scales from Study 1

Proactivity (Seibert et al., 1999)

1. I am constantly on the lookout for new ways to improve my life.
2. Wherever I have been, I have been a powerful force for constructive change.
3. Nothing is more exciting than seeing my ideas turn into reality.
4. If I see something I don't like, I fix it.
5. No matter what the odds, if I believe in something I will make it happen.
6. I love being a champion for my ideas, even against others' opposition.
7. I excel at identifying opportunities.
8. I am always looking for better ways to do things.
9. If I believe in an idea, no obstacle will prevent me from making it happen.
10. I can spot a good opportunity long before others can.

APPENDIX D

Revised Biodata Scale for Study 1

When you were elementary school age (11 and younger)...

Background Influences

1) Being Exposed or Encouraged for STEM

1. How often did you talk to siblings or cousins who were studying STEM in high school or college about STEM topics?
2. How often did you interact with adults in STEM fields who were not related to you?
3. What proportion of your parents, siblings, or extended family worked in a STEM career while you were growing up?
4. How often did adults in STEM careers tell you about their career?
5. How often did your parents talk to you about the importance of choosing a STEM major in college?
6. To what extent did your parents encourage you to pursue a STEM interest due to your innate talent or ability for the topic?
7. To what extent did your parents encourage you to work in a specific STEM career because that career would have plenty of jobs available?
8. To what extent did your parents encourage you to pursue STEM at the expense of your non-STEM interests?
9. How often did adults in STEM careers tell you that you would do well in a similar career?
10. How much influence did your parents have on the school topics you were interested in?

2) Being Provided STEM Resources

11. How likely were your parents to provide you with the materials to work on STEM-related projects?
12. How often did you attend multi-day STEM events, such as STEM-related summer camps?
13. How often did you attend one-day science, math, or engineering events, such as talks or demonstrations?
14. How often did you participate in non-competitive science, math, or engineering-focused events for students, such as career days, field trips, or exhibitions?
15. How often did your parents encourage you to work on STEM-related projects?
16. How often did your parents or teachers give you STEM-related books, toys, or other STEM gifts?
17. How willing were your parents to pay for new STEM activities for you to try?
18. To what extent did your family provide you with books, movies, or TV shows about a certain STEM career path?
19. Were your parents more likely to pay for you to participate STEM activities than in non-STEM activities?

20. How willing were your parents or other family members to pay for hands-on STEM project materials for you?

Learning Experiences

3) Having Hands-on STEM Experiences

21. How likely were you to get bored of working on mandatory hands-on STEM activities? (RC)
22. How much access did you have to hands-on STEM materials at home?
23. How much did you generally prefer to work on hands-on STEM activities compared to other hobbies?
24. How much did you look forward to working on hands-on STEM activities in your classes?
25. How often did you do hands-on math assignments, such as math blocks, puzzles, geometry projects, or filling in graphs or charts?
26. How often did you go on field trips to activities or places where you were able to touch or build things?
27. How often did you work on engineering, building, or construction projects in class?
28. How often did you work on science experiments or projects in class?
29. How often did you work on science fair projects at school?
30. How often did you choose to work on hands-on STEM activities (e.g. experiments, building projects, lab activities) after school when you had the choice to do other activities?

4) Participating in STEM Competitions

31. How likely were you to participate in math competitions that were voluntary?
32. How likely were you to participate in science competitions that were voluntary?
33. How likely were you to spend a lot of time after school preparing for math competitions?
34. How likely were you to spend a lot of time after school preparing for science competitions?
35. How much did you look forward to opportunities to participate in math competitions?
36. How much did you look forward to opportunities to participate in science competitions?
37. How often did you participate in math competitions?
38. How often did you participate in science competitions?
39. To what extent did your parents expect you to participate in science competitions?
40. To what extent did your teachers encourage you to participate in science competitions?

5) Receiving Help on School Assignments

41. How capable were your parents of helping you on a math assignment if you needed help?
42. How capable were your parents of helping you on a science assignment if you needed help?
43. How helpful did you think your parents would be if you had trouble with an assignment?
44. How helpful were most of your teachers if you were struggling with an assignment?

45. How often did your parents ask you if you needed help with your homework?
46. How often did your parents help you study for tests?
47. How often did your teachers specifically encourage you in particular to do well in class?
48. How skilled were most of your teachers at explaining new topics to the class?
49. To what extent did you believe your teachers prioritized helping other students over you?
(RC)
50. To what extent did your parents expect you to figure out difficult class assignments on your own? (RC)

6) Proactive or Voluntary STEM Behaviors

51. How willing were you to approach your teacher with science or math questions after class?
52. How comfortable did you feel asking your teacher science or math questions during class?
53. How likely were you to ask for STEM-related gifts for your birthday or another holiday?
54. How likely were you to ask your parents for help with a class assignment if you were struggling with it?
55. How likely were you to ask your parents for parts or materials so you could work on hands-on STEM activities?
56. How likely were you to choose to attend or participate in STEM events that were voluntary?
57. How likely were you to look up instructional videos or books to complete difficult assignments on your own?
58. How likely were you to seek out information on STEM events you wanted to attend?
59. How likely were you to work on extracurricular or extra credit math assignments just because you wanted to?
60. How likely were you to work on recreational science projects just because you wanted to?

APPENDIX E

Career Outcome Expectancies Scales

1) Mathematics & Science Career Outcome Expectancies (Fouad et al., 1997)

This was originally a middle school test (Fouad et al., 1997), that I altered slightly to apply to college students (changing items to refer to career plans rather than high school plans).

Instructions: Please indicate the degree to which you agree or disagree with each statement below by selecting one of the following. (*1 = Strongly Disagree; 2 = Disagree; 3 = Uncertain; 4 = Agree; 5 = Strongly Agree*)

1. If I take a lot of college math courses, then I will be better able to achieve my future goals. (M)
2. If I learn math well, then I will be able to work in lots of different types of careers. (M)
3. If I take a math course, then I will increase my GPA. (M)
4. If I do well in science classes in college, then I will do well in my future career. (S)
5. If I get good grades in my math courses, then my parents will be pleased. (M)
6. If I do well in my science sciences, then I will be better prepared for my future career. (S)
7. I plan to take more math classes than required to graduate. (M)
8. I intend to take more science classes than the minimum required for my major. (S)
9. I am committed to studying hard in my biology, chemistry, or physics classes. (S)
10. I intend to enter a career that will use math. (M)
11. I am determined to use my science knowledge in my future career. (S)
12. I intend to enter a career that will use science. (S)

2) Career Outcome Expectations (Hazari et al., 2010)

This is a six-point Likert scale ranging from 1 (“Not at all important”) to 6 (“Very important.”) It was originally used to assess physics identity in high school students; I altered the instructions slightly to apply to college students.

Instructions: Please rate these items in terms of their importance for your career satisfaction once you graduate from college.

(Extraneous)

1. Making money
2. Having others working under your supervision
3. Having an easy job
4. Becoming well known

(Intrinsic Reward)

5. Inventing new things
6. Making use of your talents/abilities
7. Developing new knowledge and skills
8. Having an exciting job

(Personal Time)

9. Having time for yourself/friends
10. Having time for family

(People-Related)

11. Helping other people
12. Working with people rather than objects

(Other Outcome Expectations)

13. Having job security
14. Making your own decisions
15. Working in an area with lots of job opportunities

APPENDIX F

Self-Efficacy Scales

1) Math Self-Efficacy

For math self-efficacy, I adapted two items from a middle school self-efficacy questionnaire (Fouad et al., 1997), to be appropriate for college students, as well as six items from Betz and Hackett's (1983) scale.

Instructions: Indicate your ability to do each of the following statements below. (1 = Very High Ability; 2 = High Ability; 3 = Uncertain; 4 = Low Ability; 5 = Very Low Ability)

1. Earn at least a 3.5 average GPA in all math courses
2. Get an A- or higher in upper-level math classes.
3. Add two large numbers (e.g., $5739 + 62543$) in your head
4. Set up a monthly budget for yourself
5. Figure out the tip on your part of a dinner bill split eight ways
6. Compute your car's gas mileage
7. Figure out which of two summer internships is the better offer; one with a higher hourly pay but no benefits, the other with a lower hourly pay plus room, board, and travel expenses
8. Figure out how much you would save if there is a 15% markdown on an item you wish to buy

2) Science Self-Efficacy

For science self-efficacy, I adapted ten items from a questionnaire by Smist (1993) to be appropriate for college students.

Instructions: Indicate your ability to do each of the following statements below. (1 = Very High Ability; 2 = High Ability; 3 = Uncertain; 4 = Low Ability; 5 = Very Low Ability)

1. Earn an A in a first-year college biology course
2. Earn an A in a first-year college chemistry course
3. Earn an A in a first-year college physics course
4. Graduate with a 3.5 or higher GPA in your science, math, and engineering courses
5. Understand concepts in a college biology textbook
6. Use a microscope
7. Understand abstract chemical concepts
8. Use chemical formulas and equations
9. Perform lab experiments with simple machines
10. Do physics lab assignments well

3) Major self-efficacy scale (Betz & Hackett, 1981)

This scale is based on the educational requirements subscale of the college major self-efficacy scale. I included all the classic STEM majors, plus the most common majors on the National Center for Education Statistics' list of most popular majors in the US.

Instructions: Please rate your level of confidence in being able to successfully complete graduate with the following majors from 1 = "Completely Unsure" to 10 = "Completely Sure."

1. Engineering
2. Math
3. Physics
4. Chemistry
5. Biology

6. Computer Science
7. Astronomy
8. Geology
9. Statistics
10. English Literature
11. History
12. Accounting and Finance
13. Visual and Performing Arts
14. Marketing
15. Education
16. Psychology
17. Health Sciences (including pre-med)

APPENDIX G
STEM Interest Scales

1) Math Interest (Frenzel et al., 2010)

I adapted several of these items to be more specific to college-level math interest.

Responses are scored using 5-point Likert agreement scales ranging from *1 = Strongly Disagree* to *5 = Strongly Agree*.

1. I am interested in calculus
2. I am interested in advanced algebra
3. I like to read non-fiction books related to mathematics
4. Solving math problems is one of my favorite activities
5. I often find the things we deal with in mathematics really exciting
6. After a math class, I am often curious about what we are going to do in the next lesson
7. I would like to learn much more about some of the topics we deal with in mathematics classes

2) STEM Career Interest Test (Milner et al., 2014)

Instructions: Please rate how interested you would be in performing the following tasks.

Responses are scored using 5-point Likert agreement scales ranging from *1 = Strongly Disinterested* to *5 = Strongly Interested*.

1. Redesign an engine to improve fuel efficiency.
2. Measure the speed of electrons.
3. Maintain the main generator in a power plant.
4. Analyze problems in aircraft design.
5. Study the nature of quantum physics.

6. Study the laws of gravity.
7. Apply mathematical techniques to practical problems.
8. Create a computer database.

APPENDIX H

Choice Goal and Choice Action

1. What was the major you declared when you first entered college? If you did not declare a major, which major did you think you would most likely choose at the time?
2. Which major do you think you are most likely to choose now?

APPENDIX I

Revised Biodata Scale for Study 2

When you were elementary school age (11 and younger)...

Academic Background Experiences

General Parent Influence and Support

1. How capable were your parents of helping you on a math assignment if you needed help?
2. How capable were your parents of helping you on a science assignment if you needed help?
3. How helpful did you think your parents would be if you had trouble with an assignment?
4. How much access did you have to hands-on STEM materials at home?
5. How much influence did your parents have on the school topics you were interested in?
6. How often did you ask your parents for help with a class assignment if you were struggling with it?
7. How often did your parents ask you if you needed help with your homework?
8. How often did your parents help you study for tests?
9. How willing were your parents or other family members to pay for hands-on STEM project materials for you?
10. How willing were your parents to pay for new STEM activities for you to try?
11. To what extent did your parents expect you to figure out difficult class assignments on your own? (RC)
12. What proportion of your parents, siblings, or extended family worked in a STEM career while you were growing up?

Skill and Helpfulness of Teachers

13. How comfortable did you feel asking your teacher science or math questions during class?
14. How helpful were most of your teachers if you were struggling with an assignment?
15. How often were your teachers enthusiastic and encouraging in their classroom teaching style?*
16. How skilled were most of your teachers at explaining new topics to the class?
17. How willing were you to approach your teacher with science or math questions after class?
18. To what extent did your teachers provide more support to other students than to you? (RC)*

STEM Learning Experiences

Information-Oriented Receipt of STEM Knowledge

19. How often did adults in STEM careers tell you about their career?
20. How often did adults in STEM careers tell you that you would do well in a similar career?
21. How often did you attend multi-day STEM events, such as STEM-related summer camps?
22. How often did you attend one-day science, math, or engineering events, such as talks or demonstrations?
23. How often did you go on field trips to activities or places where you were able to touch or build things?
24. How often did you interact with adults in STEM fields who were not related to you?
25. To what extent did you look forward to working on hands-on STEM activities in your classes?

26. How often did you participate in non-competitive science, math, or engineering-focused events for students, such as career days, field trips, or exhibitions?
27. How often did you work on engineering, building, or construction projects in class?
28. How often did your parents or teachers give you STEM-related books, toys, or other STEM gifts?
29. How often did you talk to relatives (e.g. older cousins or siblings) who were studying STEM in college about their STEM major?*

Extracurricular Math Competitions & Activities

30. How often did you participate in math competitions?
31. How often did you participate in math competitions that were voluntary?
32. How often did you spend a lot of time after school preparing for math competitions?
33. How often did you look forward to opportunities to participate in math competitions?
34. How often did you work on extracurricular or extra credit math assignments just because you wanted to?
35. How likely were you to choose to work on math assignments, such as math blocks, puzzles, geometry projects, or filling in graphs or charts, when you had the choice to do other activities?*

Extracurricular Science Competitions & Activities

36. How likely were you to choose to work on science activities (such as experiments or hands-on science projects) after school when you had the choice to do other activities?*
37. How likely were you to get bored of working on extracurricular science activities during class?*
38. How much did you generally prefer to work on hands-on building or construction hobbies compared to other hobbies?*
39. How much did you look forward to participating in science competitions?*
40. How much time did you spend after school preparing for science competitions or science fairs?*
41. How often did you participate in science competitions?
42. How often did you work on science experiments or projects in class?
43. How often did you work on science fair projects at school?
44. To what extent did your parents expect you to participate in non-required science competitions?
45. To what extent did your teachers encourage you to participate in science competitions?

Proactive and Voluntary STEM-Seeking Behavior

46. How likely were you to ask an older sibling or adult how to solve a homework problem you were struggling with?*
47. How likely were you to look up on your own how to solve a homework problem you were struggling with?*
48. How often did you ask for STEM-related gifts for your birthday or another holiday?
49. How often did you ask your parents for parts or materials so you could work on hands-on STEM activities?
50. How often did you choose to attend or participate in STEM events that were voluntary?
51. How often did you seek out information on STEM events you wanted to attend?
52. How often did you work on recreational science projects just because you wanted to?
53. To what extent did your family provide you with books, movies, or TV shows about a certain STEM career path because you showed an interest in it?*

Parental Statements of Support for STEM

54. How likely were your parents to work on science or engineering projects with you?*
55. How often did your parents talk to you about the importance of choosing a STEM major in college?
56. To what extent did your parents encourage you to pursue a STEM interest due to your innate talent or ability for the topic?
57. To what extent did your parents encourage you to pursue STEM at the expense of your non-STEM interests?
58. To what extent did your parents encourage you to work in a specific STEM career because that career would have plenty of jobs available?
59. To what extent did your parents expect you to work hard on your science projects, even if it meant you had less free time?*
60. To what extent were your parents more willing to pay for you to participate STEM activities than in non-STEM activities?

*Note: *Altered items*

APPENDIX J

Other Scales Used in Study 2

Standardized Test Performance

1. What was your highest SAT score by test section? Please estimate scores on each section if you cannot remember the exact numbers.
 - a. Math
 - b. Reading and Writing
2. What was your highest ACT score by test section? Please estimate scores on each section if you cannot remember the exact numbers.
 - a. Math
 - b. Reading
 - c. Science
 - d. Writing

Major Choices

1. What was the major you declared when you first entered Rice? (If you did not declare a major, which major did you think you would most likely choose at the time?)
2. What was your second choice major when you first entered Rice?
3. Which major do you think you are most likely to graduate with now?
4. How confident are you that you will graduate with this major?
5. If you do not end up graduating with your most likely major, what is the second most likely major that you will graduate with?

All currently available Rice majors listed.

Perceptions of First Semester Performance

1. Which of the following reflects how you feel about the quality of your effort in your classes last semester? (Very Little Effort (1) to The Maximum Amount of Effort (5))
2. Which of the following reflects how you feel about your course grades last semester? (Very Unsatisfied (1) to Very Satisfied (5))

Career Plans

1. When you started Rice, which career field(s) did you think you were most likely to enter when you graduated (and after any required post-undergraduate education)? You may select up to three.
2. Which career field(s) do you currently think you are most likely to enter when you graduate (and after any required post-undergraduate education)? You may select up to three.

Industry Options (select up to three).

- Agriculture, Food & Natural Resources
- Architecture & Construction
- Arts, Audio/Video Technology & Communications
- Business Management & Administration
- Education & Training
- Engineering^a
- Finance
- Government & Public Administration
- Health Science Practitioner (e.g. physician, dentist)
- Hospitality & Tourism
- Human Services
- Information Technology & Computer Science^b
- Law, Public Safety, Corrections & Security
- Manufacturing
- Marketing
- Research (e.g. at university or private firm)
- Science or Math^a
- Transportation, Distribution & Logistics

^aThe “Science or Math” item was separated from the “Engineering” item; ^b“Computer Science” was added to the “Information Technology” item to explicitly capture this career path
